# Disclaimer

**ContractWolf.io** audits and reports should not be considered as a form of project's "advertisement" and does not cover any interaction and assessment from "project's contract" to "external contracts" such as Pancakeswap or similar.

**ContractWolf** does not provide any warranty on its released reports.

**ContractWolf** should not be used as a decision to invest into an audited project and is not affiliated nor partners to its audited contract projects.

**ContractWolf** provides transparent report to all its "clients" and to its "clients participants" and will not claim any guarantee of bug-free code within its **SMART CONTRACT**.

**ContractWolf** presence is to analyze, audit and assess the client's smart contract's code.

Each company or projects should be liable to its security flaws and functionalities.

## Scope of Work

**Metachain** team agreed and provided us with the files that needs to be tested (Github, Bscscan, Etherscan, files, etc.). The scope of the audit is the main contract.

The goal of this engagement was to identify if there is a possibility of security flaws in the implementation of the contract or system.

**ContractWolf** will be focusing on contract issues and functionalities along with the projects claims from smart contract to their website, whitepaper and repository which has been provided by **Metachain**.

## Description

**Metachain** platform aims to accelerate the adoption of the Metaverse worldwide with the integration and development of Metaverse products available through MET

# Risk Level Classification

Risk Level represents the classification or the probability that a certain function or threat that can exploit vulnerability and have an impact within the system or contract.

Risk Level is computed based on CVSS Version 3.0

Level	Value	Vulnerability
Critical	9 - 10	An Exposure that can affect the contract functions in several events that can risk and disrupt the contract
High	7 - 8.9	An Exposure that can affect the outcome when using the contract that can serve as an opening in manipulating the contract in an unwanted manner
Medium	4 - 6.9	An opening that could affect the outcome in executing the contract in a specific situation
Low	0.1 - 3.9	An opening but doesn't have an impact on the functionality of the contract
Informational	0	An opening that consists of information's but will not risk or affect the contract

# Auditing Approach

Every line of code along with its functionalities will undergo manual review to check its security issues, quality, and contract scope of inheritance. The manual review will be done by our team that will document any issues that there were discovered.

## Methodology

The auditing process follows a routine series of steps:

1. Code review that includes the following:

- Review of the specifications, sources, and instructions provided to ContractWolf to make sure we understand the size, scope, and functionality of the smart contract.
- Manual review of code, our team will have a process of reading the code line-by-line with the intention of identifying potential vulnerabilities and security flaws.

2. Testing and automated analysis that includes:

- Testing the smart contract functions with common test cases and scenarios, to ensure that it returns the expected results.

3. Best practices review, the team will review the contract with the aim to improve efficiency, effectiveness, clarifications, maintainability, security, and control within the smart contract.

4. Recommendations to help the project take steps to secure the smart contract.

# Used Code from other Frameworks/Smart Contracts (Direct Imports)

## Imported Packages

- IERC20
- SafeMath
- Address
- SafeERC20
- Context
- Ownable
- IUniswapV2Factory
- IUniswapV2Router01
- IUniswapV2Router02
- IUniswapV2Pair
- MetChain

## Description

Optimization enabled: Yes

Decimal: 9

Symbol: MET

Max / Total Supply: 10,000,000

## Capabilities

### Components

Version	Contracts	Libraries	Interfaces	Abstract
1.0	1	3	5	2

### Exposed Functions

Version	Public	Private	External	Internal
1.0	15	25	43	30

### State Variables

Version	Total	Public
1.0	55	24

### Capabilities

Version	Solidity Versions Observed	Experimental Features	Can Receive Funds	Uses Assembly	Has Destroyable Contracts
1.0	v0.8.9		Yes	Yes	No

30. transferOwnership (0xf2fde38b)

# Call Graph

# SWC Attacks

ID	Title	Status
<a href="#">SWC-136</a>	Unencrypted Private Data On-Chain	PASSED
<a href="#">SWC-135</a>	Code With No Effects	PASSED
<a href="#">SWC-134</a>	Message call with hardcoded gas amount	PASSED
<a href="#">SWC-133</a>	Hash Collisions with Multiple Variable Length Arguments	PASSED
<a href="#">SWC-132</a>	Unexpected Ether balance	PASSED
<a href="#">SWC-131</a>	Presence of unused variables	PASSED
<a href="#">SWC-130</a>	Right-To Left Override control character (U+202E)	PASSED
<a href="#">SWC-129</a>	Typographical Error	PASSED
<a href="#">SWC-128</a>	DoS With Block Gas Limit	PASSED
<a href="#">SWC-127</a>	Arbitrary Jump with Function Type Variable	PASSED
<a href="#">SWC-126</a>	Insufficient Gas Griefing	PASSED
<a href="#">SWC-125</a>	Incorrect Inheritance Order	PASSED
<a href="#">SWC-124</a>	Write to Arbitrary Storage Location	PASSED
<a href="#">SWC-123</a>	Requirement Violation	PASSED
<a href="#">SWC-122</a>	Lack of Proper Signature Verification	PASSED
<a href="#">SWC-121</a>	Missing Protection against Signature Replay Attacks	PASSED
<a href="#">SWC-120</a>	Weak Sources of Randomness from Chain Attributes	PASSED
<a href="#">SWC-119</a>	Shadowing State Variables	PASSED
<a href="#">SWC-118</a>	Incorrect Constructor Name	PASSED
<a href="#">SWC-117</a>	Signature Malleability	PASSED
<a href="#">SWC-116</a>	Block values as a proxy for time	PASSED
<a href="#">SWC-115</a>	Authorization through tx.origin	PASSED
<a href="#">SWC-114</a>	Transaction Order Dependence	PASSED
<a href="#">SWC-113</a>	DoS with Failed Call	PASSED
<a href="#">SWC-112</a>	Delegate call to Untrusted Callee	PASSED
<a href="#">SWC-111</a>	Use of Deprecated Solidity Functions	PASSED

<a href="#"><u>SWC-110</u></a>	Assert Violation	PASSED
<a href="#"><u>SWC-109</u></a>	Uninitialized Storage Pointer	PASSED
<a href="#"><u>SWC-108</u></a>	State Variable Default Visibility	LOW ISSUE
<a href="#"><u>SWC-107</u></a>	Reentrancy	PASSED
<a href="#"><u>SWC-106</u></a>	Unprotected SELFDESTRUCT Instruction	PASSED
<a href="#"><u>SWC-105</u></a>	Unprotected Ether Withdrawal	PASSED
<a href="#"><u>SWC-104</u></a>	Unchecked Call Return Value	PASSED
<a href="#"><u>SWC-103</u></a>	Floating Pragma	LOW ISSUE
<a href="#"><u>SWC-102</u></a>	Outdated Compiler Version	PASSED
<a href="#"><u>SWC-101</u></a>	Integer Overflow and Underflow	PASSED
<a href="#"><u>SWC-100</u></a>	Function Default Visibility	PASSED

**THIS PROJECT WAS AUDITED VIA LOCAL FILE,  
AND IT IS NOT YET DEPLOYED ON LIVE NET**

### Low Issues

A floating pragma is set (SWC-103)	L: 7
State variable visibility is not set (SWC-108)	L: 649, L: 694, L: 774, L: 955, L: 956

# Findings

## Description:

A floating pragma is set (SWC-103)

## Suggestion:

Specific version to ensure that the bytecode does not vary between builds.

---

## Description:

State variable visibility is not set (SWC-108)

## Suggestion:

Specify variables as **public, internal, or private**.

---

## Owner can set fees up to 30%

```
function setBuyFees(uint256 marketingFee_t, uint256 taxFee_t, uint256 liquidityFee_t, uint256 burnFee_t) external onlyOwner {
    marketingFeeBuy = marketingFee_t;
    taxFeeBuy = taxFee_t;
    liquidityFeeBuy = liquidityFee_t;
    burnFeeBuy = burnFee_t;
    checkFeeValidity(marketingFee_t + taxFee_t + liquidityFee_t + burnFee_t);
}

function setSellFees(uint256 marketingFee_t, uint256 taxFee_t, uint256 liquidityFee_t, uint256 burnFee_t) external onlyOwner {
    marketingFeeSell = marketingFee_t;
    taxFeeSell = taxFee_t;
    liquidityFeeSell = liquidityFee_t;
    burnFeeSell = burnFee_t;
    checkFeeValidity(marketingFee_t + taxFee_t + liquidityFee_t + burnFee_t);
}

function setTransferFees(uint256 marketingFee_t, uint256 taxFee_t, uint256 liquidityFee_t, uint256 burnFee_t) external onlyOwner {
    marketingFeeTransfer = marketingFee_t;
    taxFeeTransfer = taxFee_t;
    liquidityFeeTransfer = liquidityFee_t;
    burnFeeTransfer = burnFee_t;
    checkFeeValidity(marketingFee_t + taxFee_t + liquidityFee_t + burnFee_t);
}

function checkFeeValidity(uint256 total_t) private pure {
    require(total_t <= 3000, "Fee above 30% not allowed");
}
```

### Suggestion:

We recommend lowering the limiter up to 25% only

---

## Owner can set max wallet limit

```
function setMaxWalletSize(uint256 _maxWalletSize_t) external onlyOwner {
    maxWalletSize = _maxWalletSize_t * 10 ** decimals;
}
```

---

## Owner can set max transaction limit

```
function setMaxTx(uint256 maxTxAmount_t) external onlyOwner() {
    maxTx = maxTxAmount_t * 10 ** decimals;
}
```

# Audit Comments

- Owner can set max wallet limit
- Owner can set buy/sell/transfer fees up to 30%
- Owner can set max tx limit
- Owner can renounce ownership
- Owner can transfer ownership
- Owner can toggle trading
- Owner can take BNB from contract
- Owner can take tokens from contract
- Owner can set automated market maker pair address and status
- Owner can set marketing wallet address
- Owner can set swap and liquify status
- Owner can set minimum LP tokens from 1 to 50
- Owner can include/exclude addresses from rewards
- Owner can include/exclude addresses from max wallet limit
- Owner can include/exclude addresses from max tx limit
- Owner can include/exclude addresses from fees
- Owner cannot burn tokens
- Owner cannot block user
- Owner cannot pause contract
- Owner cannot mint after initial deployment
