Disclaimer

ContractWolf.io audits and reports should not be considered as a form of project's "advertisement" and does not cover any interaction and assessment from "project's contract" to "external contracts" such as Pancakeswap or similar.

ContractWolf does not provide any warranty on its released reports.

ContractWolf should not be used as a decision to invest into an audited project and is not affiliated nor partners to its audited contract projects.

ContractWolf provides transparent report to all its "clients" and to its "clients participants" and will not claim any guarantee of bug-free code within its **SMART CONTRACT**.

ContractWolf presence is to analyze, audit and assess the client's smart contract's code.

Each company or projects should be liable to its security flaws and functionalities.

Scope of Work

TradeGPT team agreed and provided us with the files that needs to be tested (Github, Bscscan, Etherscan, files, etc.). The scope of the audit is the main contract.

The goal of this engagement was to identify if there is a possibility of security flaws in the implementation of the contract or system.

ContractWolf will be focusing on contract issues and functionalities along with the projects claims from smart contract to their website, whitepaper and repository which has been provided by **TradeGPT**.

Description

Step into the future of trading with our revolutionary AI-powered trading bot. Say goodbye to manual trading and hello to precision and profitability.

Risk Level Classification

Risk Level represents the classification or the probability that a certain function or threat that can exploit vulnerability and have an impact within the system or contract.

Risk Level is computed based on CVSS Version 3.0

Level	Value	Vulnerability
Critical	9 - 10	An Exposure that can affect the contract functions in several events that can risk and disrupt the contract
High	7 - 8.9	An Exposure that can affect the outcome when using the contract that can serve as an opening in manipulating the contract in an unwanted manner
Medium	4 - 6.9	An opening that could affect the outcome in executing the contract in a specific situation
Low	0.1 - 3.9	An opening but doesn't have an impact on the functionality of the contract
Informational	0	An opening that consists of information's but will not risk or affect the contract

Auditing Approach

Every line of code along with its functionalities will undergo manual review to check its security issues, quality, and contract scope of inheritance. The manual review will be done by our team that will document any issues that there were discovered.

Methodology

The auditing process follows a routine series of steps:

1. Code review that includes the following:

- Review of the specifications, sources, and instructions provided to ContractWolf to make sure we understand the size, scope, and functionality of the smart contract.
- Manual review of code, our team will have a process of reading the code line-by-line with the intention of identifying potential vulnerabilities and security flaws.

2. Testing and automated analysis that includes:

- Testing the smart contract functions with common test cases and scenarios, to ensure that it returns the expected results.

3. Best practices review, the team will review the contract with the aim to improve efficiency, effectiveness, clarifications, maintainability, security, and control within the smart contract.

4. Recommendations to help the project take steps to secure the smart contract.

Used Code from other Frameworks/Smart Contracts (Direct Imports)

Imported Packages

- Context
- Ownable
- IERC20
- IERC20Metadata
- ERC20
- IPancakeV2Factory
- IPancakeV2Router02
- ITradeGPTPass
- TradeGPT

Description

Optimization enabled: Yes

Decimal: 9

<u>SWC-101</u>	Integer Overflow and Underflow	PASSED
<u>SWC-100</u>	Function Default Visibility	PASSED

AUDIT PASSED

Low Issues

A floating pragma is set (SWC-103)	L: 65, L: 96, L:184, L: 273, L: 293
Use of “tx.origin” as a part of authorization control. (SWC-115)	L: 1001, L: 1062

Findings

Description:

A floating pragma is set (SWC-103)

Suggestion:

Specific version to ensure that the bytecode does not vary between builds.

Description:

Use of “tx.origin” as a part of authorization control (SWC-115)

Suggestion:

tx.origin should not be used for authorization. Use msg.sender instead.

Public can burn tokens

```
function burn(uint256 amount) public {  
    burn(msgSender(), amount);  
}
```

Owner can set fees up to 25%

```
function setFee(bool is_buy, uint marketing, uint aiBackup, uint ecosystem) external onlyOwner {  
    if(is_buy) {  
        buyAiBackupFee = aiBackup;  
        buyMarketingFee = marketing;  
        buyEcosystemFee = ecosystem;  
        totalBuyFee = buyMarketingFee + buyAiBackupFee + buyEcosystemFee;  
    } else {  
        sellAiBackupFee = aiBackup;  
        sellMarketingFee = marketing;  
        sellEcosystemFee = ecosystem;  
        totalSellFee = sellMarketingFee + sellAiBackupFee + sellEcosystemFee;  
    }  
    require(totalBuyFee + totalSellFee <= 250, "Total fees cannot be over 25%");  
    emit FeesChanged(buyAiBackupFee, buyMarketingFee, buyEcosystemFee,  
        sellAiBackupFee, sellMarketingFee, sellEcosystemFee);  
}
```

Owner can set max tx limit

```
function setMaxSellTxAmount(uint _value) external onlyOwner {  
    maxSellTxAmount = _value * 10 ** decimals();  
    require(maxSellTxAmount >= totalSupply() / 1000, "maxSellTxAmount should be at least 0.1% of total supply.");  
    emit MaxSellChanged(_value);  
}
```

Audit Comments

- Public can burn tokens
- Owner can set max buy/sell tx amount
- Owner can set buy/sell fees up to 25%
- Owner can renounce ownership
- Owner can transfer ownership
- Owner can take tokens from contract
- Owner can take BNB from contract
- Owner can toggle market status
- Owner can toggle buy/sell limit status
- Owner can toggle multiple buying status
- Owner can toggle send fee status
- Owner can toggle TradeGTPass status
- Owner can toggle fee status
- Owner can set minimum BNB to activate redistribution
- Owner can set fee addresses
- Owner can set TradeGTPass addresses
- Owner can set TradeGTPass fee discount
- Owner can set swap and liquify settings
- Owner can set automated market maker pair address and status
- Owner can set premarket user address and status
- Owner can update router address
- Owner can include/exclude addresses from fees
- Owner can include/exclude addresses from vesting
- Owner can disable vesting
- Owner can trigger TradeGPT migration
- Owner cannot block user
- Owner cannot pause contract
- Owner cannot mint after initial deployment
