Disclaimer

ContractWolf.io audits and reports should not be considered as a form of project's "advertisement" and does not cover any interaction and assessment from "project's contract" to "external contracts" such as Pancakeswap or similar.

ContractWolf does not provide any warranty on its released reports.

ContractWolf should not be used as a decision to invest into an audited project and is not affiliated nor partners to its audited contract projects.

ContractWolf provides transparent report to all its "clients" and to its "clients participants" and will not claim any guarantee of bug-free code within its **SMART CONTRACT**.

ContractWolf presence is to analyze, audit and assess the client's smart contract's code.

Each company or projects should be liable to its security flaws and functionalities.

Scope of Work

PWRCASH team agreed and provided us with the files that needs to be tested (Github, Bscscan, Etherscan, files, etc.). The scope of the audit is the main contract.

The goal of this engagement was to identify if there is a possibility of security flaws in the implementation of the contract or system.

ContractWolf will be focusing on contract issues and functionalities along with the projects claims from smart contract to their website, whitepaper and repository which has been provided by **PWRCASH**.

Description

PWRCASH is a highly secure and user-friendly tool for moving your digital assets between different blockchains while maintaining a high level of anonymity and privacy.

Risk Level Classification

Risk Level represents the classification or the probability that a certain function or threat that can exploit vulnerability and have an impact within the system or contract.

Risk Level is computed based on CVSS Version 3.0

Level	Value	Vulnerability
Critical	9 - 10	An Exposure that can affect the contract functions in several events that can risk and disrupt the contract
High	7 - 8.9	An Exposure that can affect the outcome when using the contract that can serve as an opening in manipulating the contract in an unwanted manner
Medium	4 - 6.9	An opening that could affect the outcome in executing the contract in a specific situation
Low	0.1 - 3.9	An opening but doesn't have an impact on the functionality of the contract
Informational	0	An opening that consists of information's but will not risk or affect the contract

Auditing Approach

Every line of code along with its functionalities will undergo manual review to check its security issues, quality, and contract scope of inheritance. The manual review will be done by our team that will document any issues that there were discovered.

Methodology

The auditing process follows a routine series of steps:

1. Code review that includes the following:

- Review of the specifications, sources, and instructions provided to ContractWolf to make sure we understand the size, scope, and functionality of the smart contract.
- Manual review of code, our team will have a process of reading the code line-by-line with the intention of identifying potential vulnerabilities and security flaws.

2. Testing and automated analysis that includes:

- Testing the smart contract functions with common test cases and scenarios, to ensure that it returns the expected results.

3. Best practices review, the team will review the contract with the aim to improve efficiency, effectiveness, clarifications, maintainability, security, and control within the smart contract.

4. Recommendations to help the project take steps to secure the smart contract.

Used Code from other Frameworks/Smart Contracts (Direct Imports)

Imported Packages

- SafeMath
- Context
- Ownable
- IUniswapV2Factory
- IUniswapRouter01
- IUniswapRouter02
- IERC20
- IERC20Metadata
- PWRCASH

Description

Optimization enabled: No

Decimal: 18

<u>SWC-100</u>	Function Default Visibility	PASSED

Audit Result

AUDIT PASSED

Low Issues

State variable visibility is not set (SWC-108)	L: 568, 573, 591
--	------------------

Findings

Description:

State variable visibility is not set (SWC-108)

Suggestion:

Variables can be specified as being public, internal, or private. Explicitly define visibility for all state variables.

Owner has public burn function

```
function burn(uint256 amount) public virtual {  
    _burn(msgSender(), amount);  
}
```

Contract has default tax and owner can remove tax permanently

```
function removeCuts() external onlyOwner {  
    txCut["marketingBuy"] = 0;  
    txCut["farmingBuy"] = 0;  
  
    txCut["marketingSell"] = 0;  
    txCut["farmingSell"] = 0;  
  
    emit Cuts(  
        0,  
        0,  
        0,  
        0  
    );  
}
```

```
txCut["marketingBuy"] = 75;  
txCut["farmingBuy"] = 75;  
  
txCut["marketingSell"] = 75;  
txCut["farmingSell"] = 75;
```

Owner can withdraw tokens from contract

```
function withdrawAnyToken(address payable _to, IERC20 _token) public onlyOwner {  
    _token.transfer(_to, _token.balanceOf(address(this)));  
}
```

Audit Comments

- Contract has public burn function
- Owner can renounce and transfer ownership
- Contract has default tax and owner can remove tax permanently
- Owner can change tax address
- Owner can exclude/include addresses from tax
- Owner can exclude/include addresses from transaction limit
- Owner can remove transaction limit permanently
- Owner can update swap token settings
- Owner can manually swap tokens for native
- Owner can manually send native tokens to tax address
- Owner can withdraw tokens from contract
- Owner cannot mint after initial deployment
- Owner cannot pause contract
- Owner cannot block users
