Disclaimer

ContractWolf.io audits and reports should not be considered as a form of project's "advertisement" and does not cover any interaction and assessment from "project's contract" to "external contracts" such as Pancakeswap or similar.

ContractWolf does not provide any warranty on its released reports.

ContractWolf should not be used as a decision to invest into an audited project and is not affiliated nor partners to its audited contract projects.

ContractWolf provides transparent report to all its "clients" and to its "clients participants" and will not claim any guarantee of bug-free code within its **SMART CONTRACT**.

ContractWolf presence is to analyze, audit and assess the client's smart contract's code.

Each company or projects should be liable to its security flaws and functionalities.

Scope of Work

Pollux Protocol team agreed and provided us with the files that needs to be tested (Github, Bscscan, Etherscan, files, etc.). The scope of the audit is the main contract.

The goal of this engagement was to identify if there is a possibility of security flaws in the implementation of the contract or system.

ContractWolf will be focusing on contract issues and functionalities along with the projects claims from smart contract to their website, whitepaper and repository which has been provided by **Pollux Protocol**.

Description

Pollux Protocol is building the first of its kind multi chain DeFi ecosystem utilising 6 different Crypto Networks. We are creating easy to use white label solutions for other projects to build on cross chain!

Risk Level Classification

Risk Level represents the classification or the probability that a certain function or threat that can exploit vulnerability and have an impact within the system or contract.

Risk Level is computed based on CVSS Version 3.0

Level	Value	Vulnerability
Critical	9 - 10	An Exposure that can affect the contract functions in several events that can risk and disrupt the contract
High	7 - 8.9	An Exposure that can affect the outcome when using the contract that can serve as an opening in manipulating the contract in an unwanted manner
Medium	4 - 6.9	An opening that could affect the outcome in executing the contract in a specific situation
Low	0.1 - 3.9	An opening but doesn't have an impact on the functionality of the contract
Informational	0	An opening that consists of information's but will not risk or affect the contract

Auditing Approach

Every line of code along with its functionalities will undergo manual review to check its security issues, quality, and contract scope of inheritance. The manual review will be done by our team that will document any issues that there were discovered.

Methodology

The auditing process follows a routine series of steps:

1. Code review that includes the following:

- Review of the specifications, sources, and instructions provided to ContractWolf to make sure we understand the size, scope, and functionality of the smart contract.
- Manual review of code, our team will have a process of reading the code line-by-line with the intention of identifying potential vulnerabilities and security flaws.

2. Testing and automated analysis that includes:

- Testing the smart contract functions with common test cases and scenarios, to ensure that it returns the expected results.

3. Best practices review, the team will review the contract with the aim to improve efficiency, effectiveness, clarifications, maintainability, security, and control within the smart contract.

4. Recommendations to help the project take steps to secure the smart contract.

Used Code from other Frameworks/Smart Contracts (Direct Imports)

Imported Packages

- Context
- IUniswapV2Factory
- IERC20
- IERC20Metadata
- ERC20
- DividendPayingTokenOptionalInterface
- DividendPayingTokenInterface
- SafeMath
- Ownable
- SafeMathInt
- SafeMathUint
- IUniswapV2Router01
- IUniswapV2Router02
- DividendPayingToken
- DividendTracker
- Pollux

Description

Optimization enabled: Yes

Decimal: 18

Write Functions of Contract

1. addPresaleAddressForExclusions

2. approve

3. cancelLPWithdrawRequest

4. claim

5. decreaseAllowance

6. disableTransferDelay

7. enableTrading

8. excludeFromDividends

9. excludeFromFees

10. excludeFromMaxTransaction

11. excludeMultipleAccountsFromFees

12. includeInDividends

13. increaseAllowance

14. processDividendTracker

15. removeLimits

16. renounceOwnership

17. requestToWithdrawLP

18. setAutomatedMarketMakerPair

19. transfer

20. transferFrom

21. transferOwnership

22. updateBuyFees

23. updateClaimWait

24. updateGasForProcessing

25. updateMarketingWallet

26. updateMaxAmount

27. updateMaxWalletAmount

28. updateSellFees

29. updateSwapEnabled

30. withdrawRequestedLP

31. withdrawStuckEth

<u>SWC-100</u>	Function Default Visibility	PASSED

AUDIT PASSED

Low Issues

Use of “tx.origin” as part of authorization control (SWC-115)	L: 1479, L: 1534, L: 1535, L: 1621
Potential use of “block.number” as source of randomness (SWC-120)	L: 1342, L: 1534, L: 1535, L: 1582

Findings

Description:

Use of “tx.origin” as part of authorization control (SWC-115)

Suggestion:

tx.origin should not be used for authorization. Use msg.sender instead.

Description:

Potential use of “block.number” as source of randomness (SWC-120)

Suggestion:

- Using commitment scheme, e.g. RANDAO.
 - Using external sources of randomness via oracles, e.g. Oraclize. Note that this approach requires trusting in oracle, thus it may be reasonable to use multiple oracles.
 - Using of Bitcoin block hashes, as they are more expensive to mine.
-

Owner can set buy/sell fees up to 25%

```
function updateBuyFees(uint256 _MarketingFee, uint256 _rewardsFee, uint256 _liquidityFee) external onlyOwner {
    MarketingBuyFee = _MarketingFee;
    rewardsBuyFee = _rewardsFee;
    liquidityBuyFee = _liquidityFee;
    totalBuyFees = MarketingBuyFee + rewardsBuyFee + liquidityBuyFee;
    require(totalBuyFees <= 250, "Must keep fees at 10% or less");
}
```

```
function updateSellFees(uint256 _MarketingFee, uint256 _rewardsFee, uint256 _liquidityFee) external onlyOwner {
    MarketingSellFee = _MarketingFee;
    rewardsSellFee = _rewardsFee;
    liquiditySellFee = _liquidityFee;
    totalSellFees = MarketingSellFee + rewardsSellFee + liquiditySellFee;
    require(totalSellFees <= 250, "Must keep fees at 10% or less");
}
```

Owner can set max transaction limit not lower than 0.1% of total supply

```
function updateMaxAmount(uint256 newNum) external onlyOwner {
    require(newNum > (totalSupply() * 1 / 1000) / 1e18, "Cannot set maxTransactionAmount lower than 0.1%");
    maxTransactionAmount = newNum * (10**18);
}
```

Owner can set max wallet amount not lower than 1% of total supply

```
function updateMaxWalletAmount(uint256 newNum) external onlyOwner {
    require(newNum > (totalSupply() * 1 / 100) / 1e18, "Cannot set maxWallet lower than 1%");
    maxWallet = newNum * (10**18);
}
```

Audit Comments

- Owner can set buy/sell fees up to 25%
- Owner can renounce ownership
- Owner can transfer ownership
- Owner can include/exclude addresses from dividends
- Owner can update claim wait between 1 to 24 hours
- Owner can set presale address for exclusions
- Owner can disable transfer delay
- Owner can enable trading
- Owner can toggle swap status
- Owner can update max tx limit not lower than 0.1% of total supply
- Owner can update max wallet limit not lower than 1% of total supply
- Owner can include/exclude addresses from max tx limit
- Owner can include/exclude addresses from fees
- Owner can set automated market maker pair address and status
- Owner can set marketing wallet address
- Owner can update gas between 200,000 and 500,000
- Owner can remove limits
- Owner can take BNB from contract
- Owner can withdraw tokens from LP up to 100%
- Owner can request to withdraw tokens from LP up to 100%
- Owner can cancel withdraw request
- Owner cannot burn tokens
- Owner cannot block user
- Owner cannot pause contract
- Owner cannot mint after initial deployment
